

Image Analyzer™ SMTP Relay

The Image Analyzer SMTP Relay is a Windows SMTP service hook, which scans all emails that pass through the Windows SMTP service.

The product scans the image attachments of emails routed via the Windows SMTP service, utilising Image Analyzer's advance anti pornographic analysis technology to determine if the images are illicit in nature. Before routing the message on, the software places a tag in the header of the email denoting whether the image attachments are clean or suspect. The header tags can then be identified by a third party email content filtering solution and the appropriate policy applied to the email.

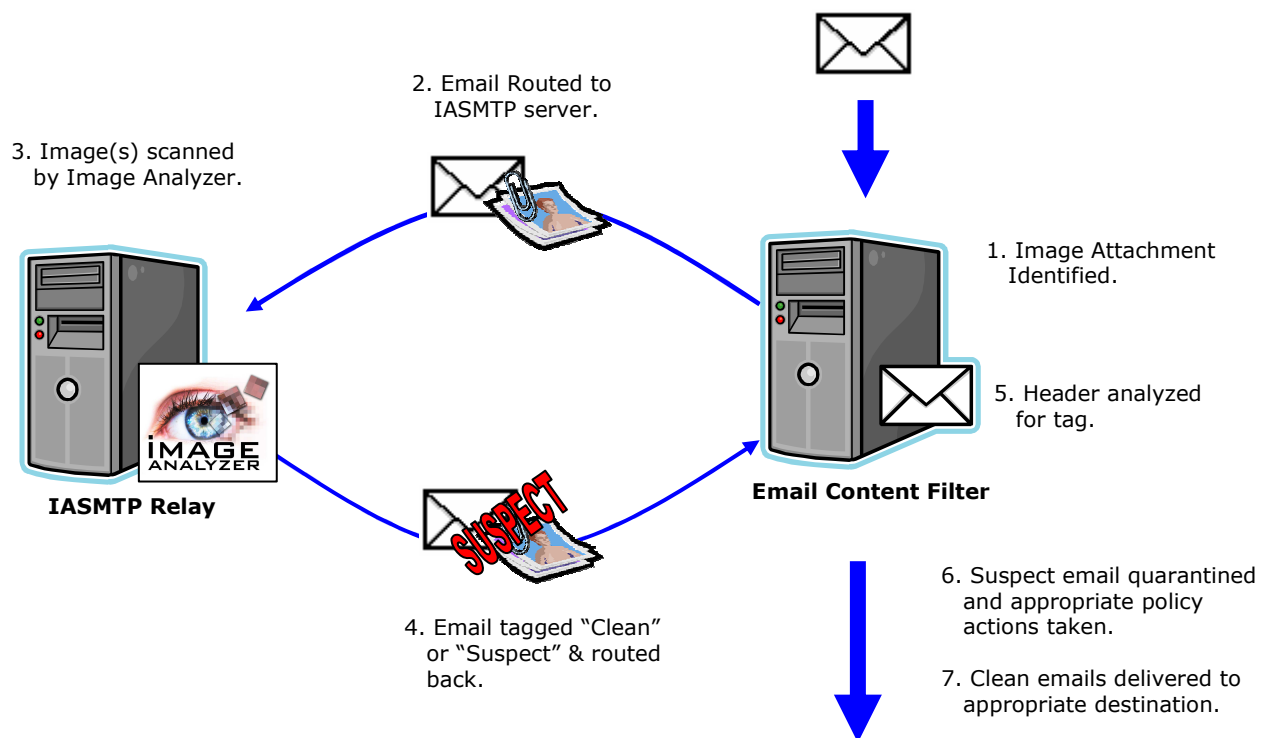

The Image Analyzer SMTP relay allows spam and email filtering managed service providers to implement a solution with minimal or no in-house development resources.

Target Verticals

Email Content Filtering
Spam Filtering
Managed Service Providers

Requirements

- **Windows 2003 server** with minimum **512 MB RAM**.
- **SMTP Service** must be installed on the Windows 2003 server.
